# What this is

A **5–8 minute screen recording** in which you run parts of your own code live and talk through what it does. It is not a presentation. It is a demonstration that the work is yours and that you understand it.

If you did the work yourself, you need to prepare nothing beyond having your submitted `Submission_Template.Rmd` open in RStudio. Don't script it.

**The rules:**

- **Screen recording with voice.** Your screen must be readable and you must speak.
- **Your face is not required.** Camera off is fine.
- **You do not need to say your name.** Your student ID and dataset fingerprint identify you.
- **One continuous take.** No editing, no jump cuts, no splicing.
- **5–8 minutes.** Aim for six.
- **Live execution only.** Chunks must run on camera. Pre-knitted output does not count.

---

# The six steps

Do them in order, in a single recording. Roughly a minute each leaves you comfortable room.

## Step 1 — Identify your work *(~1 min)*

Show `Submission_Template.Rmd` open in RStudio, with the filename visible on screen.

Scroll to the YAML header and show your **student ID**.

Run the **setup chunk** and read your **dataset fingerprint** out loud — the `EM-xxxxxx-xxxx-xxxx` code it prints. It must match the fingerprint in Section 5.1 of your report.

## Step 2 — Build your dataset live *(~1 min)*

Run your **Task 1 import and merge** chunks on camera.

When they finish, run `dim()` on your final merged master data frame and **read the number of rows and columns out loud**.

## Step 3 — Explain one wrangling decision *(~1.5 min)*

Scroll to any code chunk in **Task 1**. Point at a specific line and explain:

- Which **data-quality problem** that line handles
- What would have **gone wrong** if you had ignored it

You must name a **specific country, year or column** from your own data.

## Step 4 — Run one plot live *(~1.5 min)*

Go to any visualisation in **Task 2** and re-run the chunk so the plot renders on camera.

Point at **one element** of the plot — a bar, a line, a point — and say:

- Which **country or category** it is
- Its **approximate value**
- One sentence on **why that country sits where it does**

### Step 5 — State your model results *(~1 min)*

Go to **Task 3** and read out loud, directly from your output:

- The **RMSE of your GDP-only model** (Task 3.5)
- The **RMSE of your full model** (Task 3.6)

Then say in one sentence whether the difference between them is meaningful, and why.

### Step 6 — Your hardest moment *(~1 min)*

Scroll to the part of your report you found **most difficult**. With it visible on screen, say in two sentences what went wrong or confused you, and how you resolved it.

Then stop recording.

---

## Submitting

| | |
|---|---|
| **File name** | `[studentID]_video.mp4` |
| **Duration** | 5–8 minutes |
| **Format** | MP4 preferred; MOV accepted |
| **Resolution** | At least 720p — your screen must be readable |
| **Camera** | Not required |
| **Edits** | Not permitted; one continuous recording |
| **Where** | Inside the compressed, .zip, file |
| **Deadline** | 10:00, Tuesday, Week 14 |

Any screen recorder works — Zoom, OBS, PowerPoint, QuickTime, Xbox Game Bar. Check your audio before you record the real thing.

---

## How it's marked

On **completion and authenticity**, not on polish. You will not lose marks for being unscripted, pausing, or correcting yourself.

Markers check that:

- All six steps are present
- Code runs live, not pre-rendered
- The fingerprint you read matches your report
- The specific values, countries and column names in Steps 3, 4 and 5 are correct for **your** dataset

> A video that skips Steps 3, 4 or 5, or that shows pre-knitted output instead of live execution, is not valid.

---

# Common problems

**My recording is over 8 minutes.** You're explaining too much. Each step needs one or two sentences, not a lecture.

**A chunk fails on camera.** Say what happened and move on. A genuine error handled calmly is better than a re-recording — and far better than a fake one.

**I can't knit in time to record.** Record anyway. Run the chunks you have and be honest at Step 6 about what's incomplete.

**My numbers differ from a classmate's.** They should. Every student has a different dataset.
